

Adme RD — Requirement Document

Version 1.2 · Internal use only

This document defines Adme's Ops Screen Module — the single internal system through which Adme monitors and controls every part of the business: Merchant, Auto Rickshaw (driver + hardware), and Consumer. All dashboards, reports, and approvals described below sit within this one Adme-controlled platform; nothing here is a standalone third-party-facing app.

1. Ops Screen Module — Overview & Access

- **Merchant Dashboard:** Adme-controlled interface for configuring and monitoring merchant campaigns — setup, metrics, and redemptions all flow through Adme's system, not an independent merchant tool.
- **Consumer Dashboard:** Adme-controlled interface for consumer-facing offer discovery, scanning, and rewards; consumer activity data feeds back into Adme's Ops Screen.
- **Role-based screens:** One platform, scoped by role — Merchant, Consumer, Admin, Rickshaw-Driver, Hardware, and Super Admin each get a screen showing only what's relevant to them, but every screen is provisioned and governed centrally by Adme.

2. Merchant

2.1 Report Scheduling

- **Cron:** A background job runs automatically once a week for every merchant to compile that merchant's performance data into a report — no manual trigger needed.
- **Delivery:** The compiled report is sent out over Email (as an attachment) and WhatsApp (via Business API, with a download link), so merchants don't have to log in to see their numbers.

2.2 Report Structure (Excel, Read-Only)

The weekly/monthly report follows a fixed, locked schema so merchants can't accidentally edit the numbers:

Campaign Duration	Ad Views (Est.)	QR Scans	Offer Saved	Store Visits	Offer Redeemed
30 Days	18,000	245	96	31	18

Campaign Duration = length of the active ad run; Ad Views (Estimated) = impressions on rickshaw screens; QR Scans = number of times the offer QR was scanned; Offer Saved = consumers who bookmarked the offer; Store Visits = GPS-confirmed visits after scanning; Offer Redeemed = confirmed redemptions at the store.

2.3 Analytics

- **Multi-level access:** The same analytics engine powers dashboards for Merchant, Admin, and Super Admin, each scoped to what that role should see (single merchant vs. platform-wide) — but the data itself sits with Adme.
- **Visualizations:** Time-series graphs for daily ad views/scans, and pie charts breaking down redemption share across offer categories or time slots.

2.4 Merchant Addition

- **Onboarding:** Adme's Ops team captures business profile, store address, contact person, and GPS location (used later for geofencing and 'near me' offers).
- **Lifecycle tracking:** Adme tracks contract Expiry date, Plan Renewal status, and cumulative Total Redemptions for each merchant from the Ops Screen.

2.5 Push Notification (WhatsApp)

- **Expiry alert:** An automated WhatsApp message is sent to the merchant 5 days before their plan/campaign expires, prompting them to renew before it lapses.

2.6 Offer Number Matching

- **Two-way verification:** The consumer's app generates an offer code; the merchant enters it on their dashboard. Adme's system checks that both sides refer to the same active deal before allowing redemption — this prevents fraudulent or duplicate claims.

2.7 Approval

- **Approve Offer action:** Once the offer number matches, the merchant's dashboard shows an 'Approve' button; approving it finalizes the redemption and applies the discount or points to the consumer, logged centrally by Adme.

2.8 Categories

- **Supported categories:** Food, Drinks, Clothing, Fashion, Saloon, Jewellery, etc. — used for filtering, browsing, and analytics segmentation, maintained by Adme.

2.9 Plans

- **Pricing plans:** Configurable subscription tiers for merchants, based on factors like duration, ad-view caps, and geographic reach — defined and controlled entirely by Adme; this is what 'renewal' in 2.4 refers to.

2.10 Area Mapping

- **Geofencing:** Adme maps a merchant's campaign to specific city zones, routes, or rickshaw clusters, so ads and offers are shown to consumers in the right locality.

3. Consumer

- **QR / Offer number matching:** Consumer scans a QR code (on a rickshaw screen or physical media) or enters an offer number; Adme's system matches it against the live merchant promotion in the database.
- **GPS-based offers (Near Me):** Uses the consumer's live location to surface relevant offers within a configurable radius (e.g. 500m/1km/3km), served through Adme's platform.
- **Merchant Loyalty Points:** Points defined and awarded by an individual merchant on redemption, redeemable only at that merchant — tracked centrally in Adme's Ops Screen.
- **Adme Loyalty Points:** A separate, platform-wide points pool awarded by Adme itself (e.g. for scanning, riding, engaging), usable across the platform for vouchers/rewards.
- **Profile & History:** Consumer profile tracking total offer redemptions, saved/expired vouchers, and a running loyalty-points ledger — all visible to Adme for oversight.

4. Admin (Read-Only)

Admin is an internal Adme role with visibility into platform-wide operational metrics, but no edit or approval rights — a pure monitoring screen within the Ops Screen Module.

- **Total Live Rickshaws:** Count of rickshaws currently active/online and broadcasting location.
- **Total Redemptions:** Aggregated, real-time count of offers redeemed across the whole platform.
- **Advertiser details:** Directory of merchants/advertisers with campaign status and spend, for Adme's internal oversight.

5. Auto Rickshaw

Adme owns and operates the rickshaw fleet data end-to-end through this module — drivers and hardware are tracked assets within the Ops Screen, not a separate external system.

- **Live location:** Continuous GPS telemetry from each rickshaw streamed to Adme's servers and shown on a live map.
- **KYC:** Driver identity and document verification (license, vehicle RC, ID proof), reviewed and approved by Adme before a rickshaw goes live on the platform.
- **Rickshaw number monitoring:** Each rickshaw's registration number is mapped to its driver profile and its hardware display unit in Adme's system, so any screen can be traced back to a specific vehicle/driver.
- **GPS Map:** Interactive map (e.g. Google Maps/Mapbox) showing all active rickshaws, used by Adme for tracking and area-mapping.
- **Uptime/Downtime analysis:** A periodic heartbeat check on each screen's connectivity, used by Adme to calculate uptime/downtime — this feeds into accurate ad-impression auditing for merchants.

6. Super Admin

- **Full access:** Unrestricted create/read/update/delete access across every module — Merchant, Consumer, Admin, Rickshaw Driver, Hardware — plus system configuration, pricing/fee structure, and role management. This is Adme's highest-level internal control over the entire business.
